

News!

And it actually moves!

Due to our experience and useful comments from the user community we have given the cursor of the *ErgoDrive*[®] *Professional* mobility.

The advantage is that only the small cursor and not the whole screen image moves with small changes of the actual speed – **the strain on the eye is reduced considerably**.

The background is fixed and shows the entire speed range.

In addition to the fixed background we have an option in the program that shows an excerpt of the entire speed range (zoom). When the cursor moves to the edge of the image, the background moves along so that an optimal view is always guaranteed.

This combines the advantages of the options “fixed cursor“ and “fixed background“.

Additionally we have added a **speed zero line** for the sake of better orientation for the driver.

Customer reactions to the improvements:

Dear Mr. Fechner,

the implementation at the customer's has been a great success. The feedback of the test stand drivers regarding the new features (zero-line, fixed background, cursor, ...) has been very, very positive.

Due to the fact that the background no longer moves, the strain on the eye is reduced considerably. Also switching to a moving background at higher speeds works perfectly.
